

Tokens become DFM features

Same tokens; illustrative POS tags in parentheses

A workers (NOUN) / support (VERB) / reform (NOUN)

B workers (NOUN) / oppose (VERB) / reform (NOUN)

1 Count word tokens

Keep all word types.

`dfm(toks)`

Word columns

doc	workers	support	reform	oppose
A	1	1	1	0
B	1	0	1	1

2 Select tokens by POS

Keep NOUN: workers, reform.

`Filter tokens, then dfm().`

Word columns after POS selection

doc	workers	reform
A	1	1
B	1	1

3 Map tokens with a dictionary

PRO: support, endorse

CON: oppose, reject

`tokens_lookup(), then dfm().`

Category columns

doc	PRO	CON
A	1	0
B	0	1

Rows = documents; columns = chosen features; cells = counts.

Noun filtering loses the stance contrast; dictionary counts still need validation.
